

### Lecture 12: Classification with Support Vector Machines

Yi, Yung (이용)

Mathematics for Machine Learning

April 3, 2021

## Warm-Up

Please watch this tutorial video by Luis Serrano on Support Vector Machine.

https://youtu.be/Lpr\_\_X8zuE8

- (1) Story and Separating Hyperplanes
- (2) Primal SVM: Hard SVM
- (3) Primal SVM: Soft SVM
- (4) Dual SVM
- (5) Kernels
- (6) Numerical Solution

### Storyline

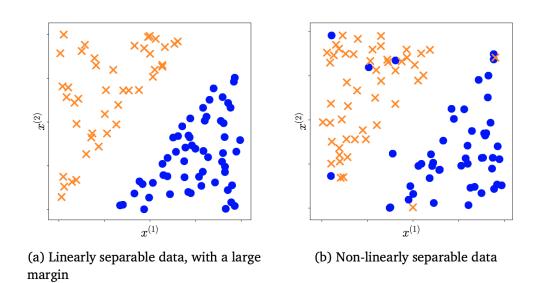

- (Binary) classification vs. regression
- A Classification predictor  $f: \mathbb{R}^D \mapsto \{+1, -1\}$ , where D is the dimension of features.
- Suppervised learning as in the regression with a given dataset  $\{(x_1, y_1), \ldots, (x_N, y_N)\}$ , where our task is to learn the model parameters which produces the smallest classification errors.
- SVM
  - Geometric way of thinking about supvervised learning
  - Relying on empirical risk minimization
  - Binary classification = Drawing a separating hyperplane
  - Various interpretation from various perspectives: geometric view, loss function view, the view from convex hulls of data points

L12(1) April 3, 2021 5 / 28

#### Hard SVM vs. Soft SVM

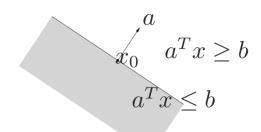

- Hard SVM: Linearly separable, and thus, allow no classification error
- Soft SVM: Non-linearly separable, thus, allow some classification error

L12(1) April 3, 2021 6 / 28

### Separating Hyperplane

- Hyperplane in  $\mathbb{R}^D$  is a set:  $\{x \mid a^\mathsf{T} x = b\}$  where  $a \in \mathbb{R}^n, a \neq 0, b \in \mathbb{R}$  In other words,  $\{x \mid a^\mathsf{T} (x x_0) = 0\}$ , where  $x_0$  is any point in the hyperplane, i.e.,  $a^\mathsf{T} x_0 = b$ .
- Divides  $\mathbb{R}^D$  into two halfspaces:  $\{x|a^\mathsf{T}x \leq b\}$  and  $\{x|a^\mathsf{T}x > b\}$

- In our problem, we consider the hyperplane  $\mathbf{w}^{\mathsf{T}}\mathbf{x} + b = 0$ , where  $\mathbf{w}$  and b are the parameters of the model.
- Classification logic

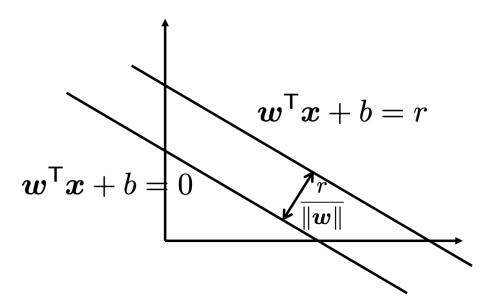

$$\begin{cases} \mathbf{w}^{\mathsf{T}} \mathbf{x}_n + b \geq 0 & \text{when } y_n = +1 \\ \mathbf{w}^{\mathsf{T}} \mathbf{x}_n + b < 0 & \text{when } y_n = -1 \end{cases} \implies y_n (\mathbf{w}^{\mathsf{T}} \mathbf{x}_n + b) \geq 0$$

L12(1)

## Distance bertween Two Hyperplanes

- Consider two hyperplanes  $\mathbf{w}^{\mathsf{T}}\mathbf{x} b = 0$  and  $\mathbf{w}^{\mathsf{T}}\mathbf{x} b = r$ , where assume r > 0.
- Question. What is the distance<sup>1</sup> between two hyperplanes? Answer:  $\frac{r}{\|w\|}$

<sup>&</sup>lt;sup>1</sup>Shortested distance between two hyperplanes.

- (1) Story and Separating Hyperplanes
- (2) Primal SVM: Hard SVM
- (3) Primal SVM: Soft SVM
- (4) Dual SVM
- (5) Kernels
- (6) Numerical Solution

L12(2) April 3, 2021 9 / 28

## Hard Support Vector Machine

- Assume that the data points are linearly separable.
- Goal: Find the hyperplane that maximizes the margin between the positive and the negative samples
- Given the training dataset  $\{(x_1, y_1), \dots, (x_N, y_N)\}$  and a hyperplane  $\mathbf{w}^\mathsf{T} \mathbf{x} + b = 0$ , what is the constraint that all data points are  $\frac{r}{\|\mathbf{w}\|}$ -away from the hyperplane?

$$y_n(\mathbf{w}^\mathsf{T}\mathbf{x}_n+b)\geq \frac{r}{\|\mathbf{w}\|}$$

• Note that r and ||w|| are scaled together, so if we fix ||w|| = 1, then

$$y_n(\mathbf{w}^{\mathsf{T}}\mathbf{x}_n+b)\geq r$$

L12(2) April 3, 2021 10 / 28

#### Hard SVM: Formulation 1

• Maximize the margin, such that all the training data points are well-classified into their classes (+ or -)

$$\max_{{\bm w},b,r} r$$
 subject to  $y_n({\bm w}^{\sf T}{\bm x}_n+b)\geq r,$  for all  $n=1,\ldots,N, \quad \|{\bm w}\|=1, \quad r>0$ 

L12(2) April 3, 2021 11 / 28

## Formulation 2 (1)

$$\max_{\boldsymbol{w},b,r} r$$
 subject to  $y_n(\boldsymbol{w}^\mathsf{T}\boldsymbol{x}_n+b) \geq r,$  for all  $n=1,\ldots,N, \quad \|\boldsymbol{w}\|=1, \quad r>0$ 

- Since  $\| \boldsymbol{w} \| = 1$ , reformulate  $\boldsymbol{w}$  by  $\boldsymbol{w}'$  as:  $y_n \Big( \frac{\boldsymbol{w'}^{1}}{\| \boldsymbol{w'} \|} \boldsymbol{x}_n + b \Big) \geq r$
- Change the objective from r to  $r^2$ .
- Define  $\mathbf{w}''$  and  $\mathbf{b}''$  by rescaling the constraint:

$$y_n\left(\frac{{oldsymbol w'}^{\mathsf{T}}}{\|oldsymbol w'\|}oldsymbol x_n + b
ight) \ge r \Longleftrightarrow y_n\left({oldsymbol w''}^{\mathsf{T}}oldsymbol x_n + b''
ight) \ge 1, \quad {oldsymbol w''} = \frac{{oldsymbol w''}}{\|oldsymbol w'\|} and b'' = \frac{b}{r}$$

L12(2) April 3, 2021 12 / 28

## Formulation 2 (2)

- Note that  $\|\mathbf{w}''\| = \frac{1}{r}$
- Thus, we have the following reformulated problem:

$$\begin{aligned} \max_{\boldsymbol{w}'',b''} & \frac{1}{\|\boldsymbol{w}''\|^2} \\ \text{subject to} & y_n \big(\boldsymbol{w}''^\mathsf{T} \boldsymbol{x}_n + b''\big) \geq 1, \text{ for all } n = 1, \dots, N, \end{aligned}$$

\_

$$\begin{split} \min_{\pmb{w},b} & \frac{1}{2} \, \| \pmb{w} \|^2 \\ \text{subject to} & y_n \big( \pmb{w}^\mathsf{T} \pmb{x}_n + b \big) \geq 1, \text{ for all } n = 1, \dots, N, \end{split}$$

L12(2) April 3, 2021 13 / 28

## Understanding Formulation 2 Intuitively

• Given the training dataset  $\{(x_1, y_1), \dots, (x_N, y_N)\}$  and a hyperplane  $\mathbf{w}^\mathsf{T} \mathbf{x} + b = 0$ , what is the constraint that all data points are  $\frac{r}{||\mathbf{w}||}$ -away from the hyperplane?

$$y_n(\mathbf{w}^\mathsf{T}\mathbf{x}_n+b)\geq \frac{r}{\|\mathbf{w}\|}$$

• Formulation 1. Note that r and ||w|| are scaled together, so if we fix ||w|| = 1, then  $y_n(\mathbf{w}^\mathsf{T} \mathbf{x}_n + b) \ge r$ .

And, maximize r.

• Formulation 2. If we fix r = 1, then

$$y_n(\mathbf{w}^{\mathsf{T}}\mathbf{x}_n+b)\geq 1.$$

And, minimize  $\|\boldsymbol{w}\|$

- (6) Numerical Solution

L12(3) April 3, 2021 15 / 28

#### Soft SVM: Geometric View

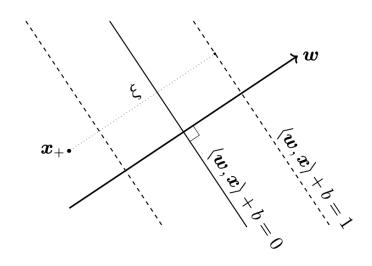

- Now we allow some classification errors, because it's not linearly separable.
- Introduce a slack variable that quantifies how much errors will be allowed in my optimization problem

• 
$$\xi = (\xi_n : n = 1, ..., N)$$

•  $\xi_n$ : slack for the *n*-th sample  $(\mathbf{x}_n, y_n)$ 

$$\begin{aligned} \min_{\boldsymbol{w},b} & \frac{1}{2} \|\boldsymbol{w}\|^2 + C \sum_{n=1}^{N} \xi_n \\ \text{subject to} & y_n \big(\boldsymbol{w}^\mathsf{T} \boldsymbol{x}_n + b\big) \geq 1 - \xi_n, \\ & \xi_n \geq 0, \quad \text{for all } n \end{aligned}$$

C: Trade-off between width and slack

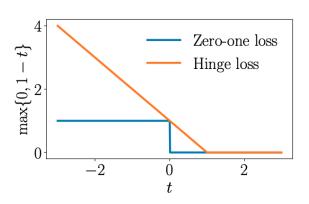

## Soft SVM: Loss Function View (1)

- From the perspective of empirical risk minimizaiton
- Loss function design
  - zero-one loss  $1(f(x_n) \neq y_n)$ : # of mismatches between the prediction and the label  $\implies$  combinatorial optimization (typically NP-hard)
  - hinge loss

$$\ell(t) = \max(0, 1 - t)$$
, where  $t = yf(\mathbf{x}) = y(\mathbf{w}^{\mathsf{T}}\mathbf{x} + b)$ 

- If x is really at the correct side,  $t \ge 1$   $\rightarrow \ell(t) = 0$
- If  ${\it x}$  is at the correct side, but too close to the boundary, 0 < t < 1  $\rightarrow 0 < \ell(t) = 1 t < 1$
- If x is at the wrong side, t < 0 $\rightarrow 1 < \ell(t) = 1 - t$

L12(3) April 3, 2021 17 / 28

## Soft SVM: Loss Function View (2)

$$\min_{\boldsymbol{w},b} (\text{regularizer} + \text{loss}) = \min_{\boldsymbol{w},b} \frac{1}{2} \|\boldsymbol{w}\|^2 + C \sum_{n=1}^{N} \max\{0, 1 - y(\boldsymbol{w}^\mathsf{T} \boldsymbol{x} + b)\}$$

- $\frac{1}{2} \| \mathbf{w} \|^2$ : L2-regularizer (margin maximization = regularization)
- C: regularization parameter, which moves from the regularization term to the loss term
- Why this loss function view = geometric view?  $\min_t \max(0,1-t) \Longleftrightarrow \min_{\xi,t} \xi, \text{ subject to } \xi \geq 0, \ \xi \geq 1-t$

L12(3) April 3, 2021 18 / 28

- (1) Story and Separating Hyperplanes

- (4) Dual SVM
- (5) Kernels
- (6) Numerical Solution

L12(4) April 3, 2021 19 / 28

#### Dual SVM: Idea

$$\min_{\boldsymbol{w},b} \ \frac{1}{2} \|\boldsymbol{w}\|^2 + C \sum_{n=1}^{N} \xi_n$$
 subject to  $y_n(\boldsymbol{w}^\mathsf{T} \boldsymbol{x}_n + b) \ge 1 - \xi_n, \ \xi_n \ge 0$ , for all  $n$ 

- The above primal problem is a convex optimization problem.
- Let's apply Lagrange multipliers, find another formulation, and see what other nice properties are shown L7(2), L7(4)
- Convert the problem into " $\leq$ " constraints, so as to apply min-min-max rule

$$\min_{\mathbf{w},b} \frac{1}{2} \|\mathbf{w}\|^2 + C \sum_{n=1}^{N} \xi_n, \text{ s.t. } -y_n(\mathbf{w}^\mathsf{T} \mathbf{x}_n + b) \le -1 + \xi_n, \ -\xi_n \le 0, \quad \text{for all } n$$

L12(4) April 3, 2021 20 / 28

## Applying Lagrange Multipliers (1)

$$\min_{\boldsymbol{w},b} \frac{1}{2} \|\boldsymbol{w}\|^2 + C \sum_{n=1}^{N} \xi_n, \text{ s.t. } -y_n(\boldsymbol{w}^\mathsf{T} \boldsymbol{x}_n + b) \leq -1 + \xi_n, \ -\xi_n \leq 0, \quad \text{for all } n$$

• Lagrangian with multipliers  $\alpha_n \geq 0$  and  $\gamma_n \geq 0$ 

$$\mathcal{L}(\boldsymbol{w}, b, \boldsymbol{\xi}, \boldsymbol{\alpha}, \boldsymbol{\gamma}) = \frac{1}{2} \|\boldsymbol{w}\|^2 + C \sum_{n=1}^{N} \xi_n - \sum_{n=1}^{N} \alpha_n \left[ y_n (\boldsymbol{w}^{\mathsf{T}} \boldsymbol{x}_n + b) - 1 + \xi_n \right] - \sum_{n=1}^{N} \gamma_n \xi_n$$

• Dual function:  $\mathcal{D}(\alpha, \gamma) = \inf_{\mathbf{w}, b, \mathbf{\xi}} \mathcal{L}(\mathbf{w}, b, \mathbf{\xi}, \alpha, \gamma)$  for which the followings should be met:

(D1) 
$$\frac{\partial \mathcal{L}}{\partial \boldsymbol{w}} = \boldsymbol{w}^{\mathsf{T}} - \sum_{n=1}^{N} \alpha_n y_n \boldsymbol{x}_n^{\mathsf{T}} = 0$$
, (D2)  $\frac{\partial \mathcal{L}}{\partial b} = \sum_{n=1}^{N} \alpha_n y_n = 0$ , (D3)  $\frac{\partial \mathcal{L}}{\partial \xi_n} = C - \alpha_n - \gamma_n = 0$ 

L12(4) April 3, 2021 21 / 28

## Applying Lagrange Multipliers (2)

• Dual function  $\mathcal{D}(\alpha, \gamma) = \inf_{\mathbf{w}, b, \xi} \mathcal{L}(\mathbf{w}, b, \xi, \alpha, \gamma)$  with (D1) is given by:

$$\mathcal{D}(\alpha, \gamma) = \frac{1}{2} \sum_{i=1}^{N} \sum_{j=1}^{N} y_i y_j \alpha_i \alpha_j \langle \mathbf{x}_i, \mathbf{x}_j \rangle - \sum_{i=1}^{N} y_i \alpha_i \left\langle \sum_{j=1}^{N} y_j \alpha_j \mathbf{x}_j, \mathbf{x}_i \right\rangle - b \sum_{i=1}^{N} y_i \alpha_i + \sum_{i=1}^{N} \alpha_i + \sum_{i=1}^{N} (C - \alpha_i - \gamma_i) \xi_i$$

From (D2) and (D3), the above is simplified into:

$$\mathcal{D}(\boldsymbol{\alpha}, \boldsymbol{\gamma}) = \frac{1}{2} \sum_{i=1}^{N} \sum_{j=1}^{N} y_i y_j \alpha_i \alpha_j \langle \boldsymbol{x}_i, \boldsymbol{x}_j \rangle + \sum_{i=1}^{N} \alpha_i$$

•  $\alpha_i, \gamma_i \geq 0$  and  $C - \alpha_i - \gamma_i = 0 \implies 0 \leq \alpha_i \leq C$ 

L12(4) April 3, 2021 22 / 28

#### **Dual SVM**

• (Lagrangian) Dual Problem: maximize  $\mathcal{D}(\alpha, \gamma)$ 

$$\begin{aligned} & \min_{\alpha} & \frac{1}{2} \sum_{i=1}^{N} \sum_{j=1}^{N} y_i y_j \alpha_i \alpha_j \left\langle \mathbf{x}_i, \mathbf{x}_j \right\rangle + \sum_{i=1}^{N} \alpha_i \\ & \text{subject to} & \sum_{i=1}^{N} y_i \alpha_i = 0, \quad 0 \leq \alpha_i \leq C, \ \forall i = 1, \dots, N \end{aligned}$$

- Primal SVM: the number of parameters scales as the number of features (D)
- Dual SVM
  - $\circ$  the number of parameters scales as the number of training data (N)
  - $\circ$  only depends on the inner products of individual training data points  $\langle \pmb{x}_i, \pmb{x}_j \rangle \to \text{allow}$  the application of kernel

L12(4) April 3, 2021 23 / 28

- (6) Numerical Solution

L12(5) April 3, 2021 24 / 28

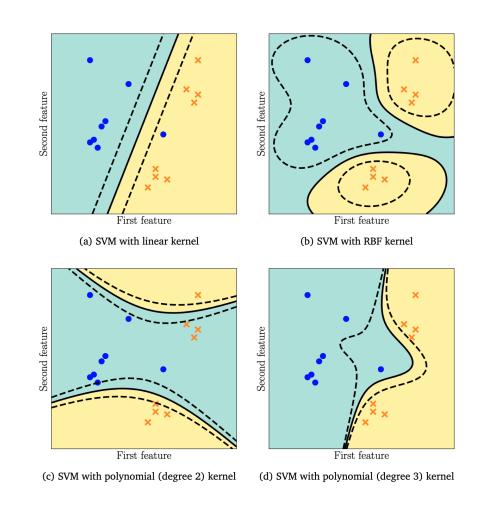

#### Kernel

• Modularity: Using the feature transformation  $\phi(x)$ , dual SVMs can be modularized

$$\langle \mathbf{x}_i, \mathbf{x}_j \rangle \implies \langle \phi(\mathbf{x}_i), \phi(\mathbf{x}_j) \rangle$$

- Similarity function  $k: \mathcal{X} \times \mathcal{X} \mapsto \mathbb{R}$ ,  $k(\mathbf{x}_i, \mathbf{x}_j) = \langle \phi(\mathbf{x}_i), \phi(\mathbf{x}_j) \rangle$
- Kernel matrix, Gram matrix: must be symmetric and positive semidifinite
- Examples: polynomial kernel, Gaussian radial basis function, rational quadratic kernel
